Git & GitHub

by @kinbiko

on 2018-01-31

» Outline

- * High Level Overview
- * Git
- * Learn by doing #1
- * GitHub
- * Learn by doing #2
- * Closing remarks

» Why use Git and GitHub

- * FINAL/DRAFT/v1.2 
- * Work is shared (distributed)
- * Create a portfolio

» Difference between Git and GitHub

- * Git
 - * Versioning your files
 - * Command-line program
- * GitHub
 - * Collaboration
 - * Free web service (github.com)

» Git: Versioning

- * Multiple versions, one file
- * Go back to any version
- * Any file type
- * Plain text files

» GitHub: Collaboration

- * Explore other projects
- * Ask open source maintainers for help*
- * Work on the same files in parallel
- * Review each other's work
- * Project management tools and issue tracking

» **Git**

- * Command line
- * GUI

» It's Git, innit?

- * `git init`
- * Directory => repository
- * Used for new projects only
- * GitHub makes this a lot easier

» Basic workflow

- * `add`: marks the files you want for your next version
- * `commit`: creates a version for the added files

» git add

- * `git add <file1> <file2> ...`
- * `git add .`
- * Adding files partially is possible (LAAEFTR), but prefer smaller changes

» git commit

- * `git commit -m "<what changed?>"`
- * Remember the “-m”, or learn Vim basics.
- * Prefer many commits to large commits

» Commit messages

- * Commit messages require discipline
- * Generally short messages - as your commits should be small
- * But complete descriptions are better than being consistently short

» git status

- * staged
- * not staged
- * New files (untracked)

» Learn by doing #1

- * Create a folder called repos
- * Create a folder inside repos called my-first-repo
- * `cd my-first-repo`
- * `git init`
- * Create and edit a README.md file
- * `git add` & `git commit` until confident
- * `git status` is your friend

» Create a GitHub account

- * `github.com/join`
- * Tell me your username

» Explore

- * Your favourite OSS projects are probably here.
- * Your favourite developers are probably here.

» Public repos for everyone

- * `github.com/new`
- * Use kebab-cased names
- * README.md and LICENSE
- * Code loves `.gitignore`

» learning-github

- * clone: get repo from somewhere else (GitHub)
- * Only owners can push
- * Anyone can clone & pull

» Push/Pull

- * `git push` puts local work on GitHub
- * `git pull` puts GitHub work on your local machine

» Forks

- * Forks copy a project to your GitHub account
- * The fork is YOURS to push and commit to
- * Use the fork to contribute to other projects with pull requests

» Pull Requests (PRs)

- * “Please pull my changes”
- * Read the CONTRIBUTING.md before raising a PR
- * Add a description, assign reviewers, look over your code in the diff view

» Working in teams

- * 90% of the way there!
- * What about updates to the original repo?
- * Solve with branches!

» Branches

- * Easy to create in GitHub
- * master is holy
- * One branch per task

» Checking out branches

- * Create branch in GitHub
- * `git pull` to update
- * `git checkout <branch-name>`

» Get new commits by merging

- * `git pull` to update
- * `git checkout my-branch`
- * To update:
 - * `git pull`
 - * `git merge origin/master` (usually)
- * (Psst! `origin == GitHub`)

» Merge conflicts

- * When two commits collide
- * Creates new commit
- * <<<<<<<<
<one commit's contents>
=====
<the other commit's contents>
>>>>>>>

» Learn by doing #2

- * Fork bath-ml/learning-git
- * Read and understand the CONTRIBUTING file.
- * Answer (using PRs) the questions in README.md
- * Review each other's PRs

» Maybe don't use Git for...

- * Large amounts of data
- * Binary files that changes a lot
- * Secrets/tokens/api keys

» Git is also used for

- * CI/CD
- * Hiring process
- * Dotfiles
